

PRODUCT/PROCESS CHANGE NOTIFICATION

PCN AMS-APD/12/7485
Dated 28 Sep 2012

**Sot23-5 halogen free material set in Nantong Fujitsu
(China) for sot23-5 Hirel & standard products**

Table 1. Change Implementation Schedule

Forecasted implementation date for change	21-Sep-2012
Forecasted availability date of samples for customer	21-Sep-2012
Forecasted date for STMicroelectronics change Qualification Plan results availability	21-Sep-2012
Estimated date of changed product first shipment	28-Dec-2012

Table 2. Change Identification

Product Identification (Product Family/Commercial Product)	See attached
Type of change	Package assembly material change
Reason for change	To improve service to ST Customers and increase capacity on SOT23-5 package
Description of the change	Progressing on the activities related to Sot23-5 manufacturing processes expansion, ST is glad to announce new material set for AMS products (Standard linear already produced in NFME or second source for products only produced in Carsem Malaysia) see product list attached) in Sot23-5. Logic products from AMS are already produced in Nantong Fujitsu with this new material set since 2011. Commercial products already produced in subcontractor Fujitsu are TS391ILT & TS321ILT. Others are currently produced in subcontractor Carsem. For samples availability, please enter a non-standard samples order in the system with in comment "PCN7485 qualification", then send the SO# to Angelique DUCHENE, she will manage to have it confirmed.
Change Product Identification	On outer box label, PP and TF code will change from 9Y to GF

CHANGE NOTIFICATION**

PCN AMS-APD/12/7485

Analog, MEMS and Sensor Group

Sot23-5 halogen free material set in Nantong Fujitsu (China) for sot23-5 Hirel & standard products.

Sot23-5

WHAT:

Progressing on the activities related to Sot23-5 manufacturing processes expansion, ST is glad to announce new material set for AMS products (Standard linear already produced in NFME or second source for products only produced in Carsem Malaysia) see product list attached) in Sot23-5. Logic products from AMS are already produced in Nantong Fujitsu with this new material set since 2011.

Product already produced in NFME:

Material	Current process	Modified process
Assembly location	Nantong Fujitsu	Nantong Fujitsu
Die attach	Ablestik 8200T	Ablestik 8200T
Wire	Gold 1Mil	Gold 1Mil
Leadframe	Copper	Copper
Molding compound	MP8000CH4 NITTO	Sumitomo EMEG600
Leadfinishing	Sn	Sn

Products today produced only in Carsem (to propose a second source)

Material	Current process	Modified process
Assembly location	Carsem	Nantong Fujitsu
Die attach	QMI519	Ablestik 8200T
Wire	Gold 1Mil	Gold 1Mil
Leadframe	Copper	Copper
Molding compound	Hitachi CEL8240HF10LXC	Sumitomo EMEG600
Leadfinishing	NiPdAu	Sn

For the complete list of the part numbers affected by the change, please refer to the attached Products list.

WHY:

To improve service to ST Customers and increase capacity for the affected packages.

HOW:

The change that covers additional Hirel & Standard products, is already qualified through attached report.

Here below you'll find the details of qualification plan.

Qualification program and results:

The qualification program consists mainly of comparative electrical characterization and reliability tests. Please refer to Appendix 1 for all the details.

WHEN:

Production in Nantong Fujitsu for AMS is forecasted end of November 2012.

Marking and traceability:

Unless otherwise stated by customer specific requirement, the traceability of the parts assembled with the new material set will be ensured by marking on label as per below description:

Manufactured under patents or patents pending

STMicroelectronics

Assembled in: **COUNTRY**

PbFree **Second level interconnect**

MSL: **X** **Bag sealed date: XX XXX XXXX**

PBT: **XXX°C** Category: **ECOPACK/Rohs**

TYPE **Commercial product**
Finished good

Total Qty: **XXXX**

Trace codes **PPYWWLLL WX TF**
PPYWWLLL WX TF
PPYWWLLL WX TF

Marking **MARKING**

Bulk Id Number

Bar code

Please provide the bulk Id for any inquiry

PP and TF code will change from 9Y to GF

- MSL: Moisture sensitivity level as per Jedec J–std-020C
- PBT: Peak body temperature (maximum temperature for reflow soldering)
- ECOPACK: present if leadfree component
- TYPE: product name
- Trace codes: PP: assembly plant code
- Y: last digit of the year of assembly
- WW: Week of assembly
- LL1: lot number
- WX: Diffusion plant code
- TF : Test&finishing plant code

- Bulk ID number: 1: Product level (T for tested product)
- Y: last digit of the year
- P: Plant code
- WW: Week of labeling
- LOT: Sequential number for lot
- BOXX: Sequential number for box

The changes here reported will not affect the electrical, dimensional and thermal parameters keeping unchanged all information reported on the relevant datasheets.

There is as well no change in the packing process or in the standard delivery quantities.

Lack of acknowledgement of the PCN within 30 days will constitute acceptance of the change. After acknowledgement, lack of additional response within the 90 day period will constitute acceptance of the change (Jedec Standard No. 46-C).

In any case, first shipments may start earlier with customer's written agreement.

Reliability Report

*Halogen free material set in Nantong Fujitsu
(China) for Hirel & Standard products in Sot23-5*

General Information		Locations	
Product Line	VG08, 0391 RR3301	Wafer fab	ST Singapore
Product Description	SINGLE 2-INPUT AND GATE, Single comparator, Ultra Low Drop Vreg@50mA 3.3 V 74V1G08STR	Assembly plant	Nantong Fujitsu (China)
P/N	TS391ILT, LD2980CM33TR	Reliability Lab	IMS-APM Catania Reliability Lab

Document reference	Short description
JESD47	Stress-Test-Driven Qualification of Integrated Circuits

2 GLOSSARY

DUT	Device Under Test
PCB	Printed Circuit Board
SS	Sample Size

3 RELIABILITY EVALUATION OVERVIEW

3.1 Objectives

To qualify halogen free material set for Sot23-5 package assembled in Nantong Fujitsu for Hirel & Standard products.

3.2 Conclusion

Qualification Plan requirements have been fulfilled without exception. It is stressed that reliability tests have shown that the devices behave correctly against environmental tests (no failure). Moreover, the stability of electrical parameters during the accelerated tests demonstrates the ruggedness of the products and safe operation, which is consequently expected during their lifetime.

4 DEVICE CHARACTERISTICS

4.1 Device description

74V1G08STR: The 74V1G08 is an advanced high-speed CMOS SINGLE 2-INPUT AND GATE fabricated with sub-micron silicon gate and double-layer metal wiring C2MOS technology. The internal circuit is composed of 2 stages including buffer output, which provide high noise immunity and stable output. Power down protection is provided on all inputs and 0 to 7V can be accepted on inputs with no regard to the supply voltage. This device can be used to interface 5V to 3V.

LD2980CM33TR: The low drop-voltage and the ultra low quiescent current make them suitable for low noise, low power applications and in battery powered systems. The quiescent current in sleep mode is less than 1 μ A when the INHIBIT pin is pulled low. A shutdown logic control function is available on pin n°3 (TTL compatible). This means that when the device is used as local regulator, it is possible to put a part of the board in standby, decreasing the total power consumption.

The LD2980 is designed to work with low ESR ceramic capacitors. Typical applications are cellular phone, laptop computer, personal digital assistant (PDA), personal stereo, camcorder and camera.

TS391ILT: This device consists of a low-power voltage comparator designed specifically to operate from a single supply over a wide range of voltages. Operation from split power supplies is also possible.

This comparator also has a unique characteristic in that the input common-mode voltage range includes ground, even though operated from a single power supply voltage.

4.2 Construction note

5.3 Tests Description

Test name	Description	Purpose
Die Oriented		
HTOL High Temperature Operating Life HTB High Temperature Bias	The device is stressed in static or dynamic configuration, approaching the operative max. absolute ratings in terms of junction temperature and bias condition.	To determine the effects of bias conditions and temperature on solid state devices over time. It simulates the devices' operating condition in an accelerated way. The typical failure modes are related to, silicon degradation, wire-bonds degradation, oxide faults.
HTSL High Temperature Storage Life	The device is stored in unbiased condition at the max. temperature allowed by the package materials, sometimes higher than the max. operative temperature.	To investigate the failure mechanisms activated by high temperature, typically wire-bonds solder joint ageing, data retention faults, metal stress-voiding.
Package Oriented		
PC Preconditioning	The device is submitted to a typical temperature profile used for surface mounting devices, after a controlled moisture absorption.	As stand-alone test: to investigate the moisture sensitivity level. As preconditioning before other reliability tests: to verify that the surface mounting stress does not impact on the subsequent reliability performance. The typical failure modes are "pop corn" effect and delamination.
AC Auto Clave (Pressure Pot)	The device is stored in saturated steam, at fixed and controlled conditions of pressure and temperature.	To investigate corrosion phenomena affecting die or package materials, related to chemical contamination and package hermeticity.
TC Temperature Cycling	The device is submitted to cycled temperature excursions, between a hot and a cold chamber in air atmosphere.	To investigate failure modes related to the thermo-mechanical stress induced by the different thermal expansion of the materials interacting in the die-package system. Typical failure modes are linked to metal displacement, dielectric cracking, molding compound delamination, wire-bonds failure, die-attach layer degradation.
THB Temperature Humidity Bias	The device is biased in static configuration minimizing its internal power dissipation, and stored at controlled conditions of ambient temperature and relative humidity.	To evaluate the package moisture resistance with electrical field applied, both electrolytic and galvanic corrosion are put in evidence.
Other		
ESD Electro Static Discharge	The device is submitted to a high voltage peak on all his pins simulating ESD stress according to different simulation models. CBM: Charged Device Model HBM: Human Body Model MM: Machine Model	To classify the device according to his susceptibility to damage or degradation by exposure to electrostatic discharge.
