Type of change	Additional assembly and test location

Description of the change

STMicroelectronics decided to expand the manufacturing capacity Power Rectifiers housed in D2PAK package with one additional assembly and test plant in China.

In order to cover both manufacturing locations D2PAK package outline dimensions, the package dimension table of the impacted products will be updated as below:

Reason for change

This additional multi-sourcing will increase our **manufacturing capacity** for a better service on the considered **Power Rectifier** devices.

Former versus changed product:	The changed products do not present modified electrical,
Tormer versus changed product.	parameters, leaving unchanged the current information
	published in the product datasheet, except for the POA.
	published in the product datasheet, except for the POA.
	The Moisture Sensitivity Level of the part (according to the
	IPC/JEDEC JSTD-020D standard) remains unchanged.
	,
	The footprint recommended by ST remains the same.
	There is no change in the packing modes and the standard
	delivery quantities either.

Disposition of former products

As the purpose is to expand the manufacturing capacity, shipments of the products processed in the initial test and assembly site will continue.

STMicroelectronics IPG - ASD & IPAD™ Division¹ BU Diodes and Rectifiers

(1) IPG: Industrial & Power Group - ASD: Application Specific Device – IPAD™: Integrated Passive and Active Devices

Marking and traceability

Parts produced in the new China location are differentiated by their marking as indicated below

		Date code marking	
Assembly location	Assy plant code	Assy year	Assy week
China 1 (ST)	GK	V (1 digit indicating	WW (2 digits
New location : China 2 (subco)	GE	T () digit indicating	

Traceability for the implemented change will be ensured by an internal codification and by the Q.A. number.

Qualification complete date August 2011

Forecasted sample availability

Product family	Sub-family	Commercial part Number	Availability date
Diodes & Rectifiers	All	All	Upon request with from 4 to 8 weeks of delay

Change implementation schedule

Sales types	Estimated production start	Estimated first shipments
All	Week 15-2014	Week 25-2014

Comments:

Customer's feedback

Please contact your local ST sales representative or quality contact for requests concerning this change notification.

3 RELIABILITY EVALUATION OVERVIEW

3.1 **Objectives**

The objective of this report is to qualify new "Halogen-Free" encapsulation molding compound for Rectifiers housed in D2PAK package at Subcontractor in China.

The encapsulation molding compound chosen for the qualification is the same, which have been qualified at ST Shenzhen plant (China).

The reliability methodology used in this qualification follows the JESD47-G: «Stress Test Driven Qualification Methodology».

Conclusion 3.2

The perimeter addressed in this campaign qualifies the production of Rectifiers housed in D2PAK package with the new "Halogen-Free" encapsulation molding compound. Reliability tests are positive.

Qualification Plan requirements have been fulfilled without exception. It is stressed that reliability tests have shown that the devices behave correctly against environmental tests (no failure). Moreover, the stability of electrical parameters during the accelerated tests demonstrates the ruggedness of the products and safe operation, which is consequently expected during their lifetime.

4 DEVICE CHARACTERISTICS

<u>4.1</u> **Device description**

Rectifiers (Power Schottky & Ultrafast Bipolar up to 400V) in D 2 PAK package with new ECOPACK®2 Molding compound assembled at subcontractor in China.

6.2 Tests description

Test name	Description	Purpose				
Die Oriented						
HTRB High Temperature Reverse Bias HTFB / HTGB High Temperature Forward (Gate) Bias	The device is stressed in static configuration, trying to satisfy as much as possible the following conditions: low power dissipation; max. supply voltage compatible with diffusion process and internal circuitry limitations;	To determine the effects of bias conditions and temperature on solid state devices over time. It simulates the devices' operating condition in an accelerated way. To maximize the electrical field across either reverse-biased junctions or dielectric layers, in order to investigate the failure modes linked to mobile contamination, oxide ageing, layout sensitivity to surface effects.				
Package Oriented						
TC Temperature Cycling	The device is submitted to cycled temperature excursions, between a hot and a cold chamber in air atmosphere.	To investigate failure modes related to the thermo-mechanical stress induced by the different thermal expansion of the materials interacting in the die-package system. Typical failure modes are linked to metal displacement, dielectric cracking, molding compound delamination, wire-bonds failure, die-attach layer degradation.				
THB Temperature Humidity Bias	The device is biased in static configuration minimizing its internal power dissipation, and stored at controlled conditions of ambient temperature and relative humidity.	To evaluate the package moisture resistance with electrical field applied, both electrolytic and galvanic corrosion are put in evidence.				
AC/PCT Auto Clave (Pressure Pot)	The device is stored in saturated steam, at fixed and controlled conditions of pressure and temperature.	To investigate corrosion phenomena affecting die or package materials, related to chemical contamination and package hermeticity.
